

Abstract

The present invention relates to a program containing a browser capable of dealing with highly functional multimedia content in a straightforward manner, and a multimedia content. A reception
5 terminal 113 accesses a server on a network 112 corresponding to an input URL. The server 124 distributes distribution software 243 to the reception terminal 113 via the network 112, the distribution software 243 being constituted of browser software 251 having specifications to be satisfied in order for a component to receive
10 predetermined services, and a multimedia content 252 having a predetermined configuration. The reception terminal 113 displays the distributed multimedia content 252 on the distributed browser. The present invention is applicable to personal computers, digital electronic home appliances and the like.
